

ABSTRACT

The present invention proposes a molded product having excellent moldability and ability to be processed into parts,
5 as well as excellent scratch resistance.

The invention provides a multilayered laminate composed of two or more layers, having a structure in which a layer (I) comprising at least one selected from an olefinic thermoplastic elastomer composition (A) and an olefinic
10 resin (B), and a layer (II) comprising an olefinic thermoplastic elastomer composition (C) are laminated. The olefinic thermoplastic elastomer composition (C) is a composition comprising [1] a specific syndiotactic polypropylene copolymer (c), and [2] at least one selected
15 from a polypropylene resin (d) and an olefinic thermoplastic elastomer (e).
